

National Essential Medicine List Tertiary Medication Review Process Component: Gender Dysphoria

MEDICINE MOTIVATION:

1. Executive Summary

Date: August 2019

Medicine (INN): Testosterone Medicine (ATC): G03BA03 Indication (ICD10 code): F64.0

Patient population: Patients with gender dysphoria – Masculinizing

Prevalence of condition: no accurate figures in SA. Recent population based surveys in the United States suggest that the number of self-identified trans people represent approximately 0.1-0.5%

of the population.^{1,2}

Level of Care: Tertiary (initiation), can be down referred are required

Prescriber Level: Multidisciplinary Specialist Team

Current standard of Care: Psychosocial/hormone/surgery therapy

Efficacy estimates: (preferably NNT)

2. Name of author(s)/motivator(s): Tertiary Committee

 Author affiliation and conflict of interest details: No applicable conflicts declared Dr Grobler – Part of Gender Clinic at Steve Biko Hospital. No other applicable conflicts declared.

4. Introduction/ Background

Gender dysphoria is defined as the distress and unease experienced if gender identity and designated gender are not completely congruent. In 2013, the American Psychiatric Association released the fifth edition of the DSM-5, which replaced "gender identity disorder" with "gender dysphoria" and changed the criteria for diagnosis.

Gender incongruence is an umbrella term used when the gender identity and/or gender expression differs from what is typically associated with the designated gender. Not all individuals with gender incongruence have gender dysphoria or seek treatment.

5. Purpose/Objective i.e. PICO question:

-P (patient/population): Gender Dysphoria - Masculinizing

-I (intervention): Testosterone-C (comparator): No therapy-O (outcome): Quality of life

6. Methods:

- **a. Data sources:** Pubmed, Cochrane Library, Google Scholar.
- b. Search strategy

("Testosterone"[Mesh]) AND "Gender Dysphoria"[Mesh]

c. Excluded studies: n/ad. Evidence synthesis

Meta-analysis

Author, date	Type of study	n	Populati on	Compara tors	Primary outcome	Effect sizes	Comments
Murad MH, et.al. 2010 ³	Systematic review and Meta- analysis	28 studies, 1833 participants (1093 male- to-female; 801 female- to-male)	Patients with gender identity disorder (GID) receiving hormona I therapy	No control	 Improvement in gender Improvement in psychological symptoms Improvement in quality of life Improvement in sexual function. 	 80% of individuals with GID reported significant improvement in gender dysphoria (95% CI = 68–89%; 8 studies; I2 = 82%); 78% reported significant improvement in psychological symptoms (95% CI = 56–94%; 7 studies; I2 = 86%); 80% reported significant improvement in quality of life (95% CI = 72–88%; 16 studies; I2 = 78%); 72% reported significant improvement in sexual function (95% CI = 60–81%; 15 studies; I2 = 78%). 	Level II evidence (observational studies, lacked control)

Evidence quality: Level II evidence

Cross-sectional study

Author, date	Type of study	n	Population	Comparators	Primary outcome	Effect sizes	Comments
Gorin- Lazard A, et.al. 2012 ⁴	Cross- sectional study	61 participants (44 received hormonal therapy)	GID individuals	No hormonal therapy	Quality of life (Short Form 36)	 Hormonal therapy was significantly associated with a higher QoL Depression was significantly associated with a lower QoL. 	

e. Evidence quality: The outcomes reported are subjective and include measures such as improvement of psychological symptoms, improvements of quality of life, improvement in gender dysphoria, and improvement in sexual function. Since there are no hard clinical outcomes, a value judgement is required.

Adverse effects: Common adverse effects include polycythemia, weight gain, acne, androgenic alopecia and sleep apnoea. Patients need to be screened for general disease risk factors which may have possible increased risk (e.g. cardiovascular disease, type 2 diabetes).⁵

Alternative agents: Alternative treatment includes changes in gender expression, surgery, and psychotherapy. The treatment interventions are individualized on a patient basis, with interventions applied in different orders.

EVIDENCE TO DECISION FRAMEWORK

	JUDGEMENT	SUPPORTING EVIDENCE & ADDITIONAL CONSIDERATIONS
QUALITY OF EVIDENCE	What is the overall confidence in the evidence of effectiveness? Confident Not Uncertain confident	Although evidence does not evaluate hard outcomes, there is support for quality of life outcomes for these patients.
BENEFITS & HARMS	Do the desirable effects outweigh the undesirable effects? Benefits Harms Benefits = outweigh outweigh harms or harms benefits Uncertain	
THERAPEUTIC	Therapeutic alternatives available: Yes No X List the members of the group. List specific exclusion from the group:	Rationale for therapeutic alternatives included: References: Rationale for exclusion from the group: Reference:
VALUES & PREFERENCES / ACCEPTABILITY	Is there important uncertainty or variability about how much people value the options? Minor Major Uncertain X Is the option acceptable to key stakeholders? Yes No Uncertain X

Recommendation	Testosterone is recommended for inclusion on the Tertiary and Quaternary Essential Medicine List for patients with gender dysphoria for the Masculinising regimen, to be initiated by specialists in a multidisciplinary team.
Rationale: Level of Evidence:	Appropriate access will assist in enabling the proper and safe use, and avoid unsafe practices.
Level of Evidence.	II and III
Review indicator: Evidence Evidence of Price of efficacy harm reduction X VEN status: Vital Essential Necessary X	
Monitoring and evaluation considerations	Individual patient monitoring required: ALT, fasting glucose, cholesterol, Haemoglobin, pregnancy test prior to initiation.
Research priorities	Patient outcomes, adverse effects of long-term treatment.
